

## CRT (Cathode ray tube).

### Description:

CRT is an audio-visual installation exploiting a peculiar effect of the Cathode Ray Tube to act as a transducer between an electronic waveform and visual information encoded into an analogue video. For the ancient Greeks sound understood as oscillatory energy is the creative force of the universe, all cultures over the world have use/d sound to attune to, invoke and transform consciousness, this installation creates interaction between a video images and a electro acoustic sound waveform, and could be thought as a tool for a inter-dimensional exploration, the cathode ray tube monitor as a window. With this work the artist speculates a view of reality where conventional and physical boundaries are collapsed as a wave-field paradigm of reality and that everything is dissolved and interconnected as oscillating fields of energy and information.
